What is claimed is:

1. A document creation support system comprising:

a database unit constructed by a template database part including document information of a template document in which

5 a character train variable and a data variable with a tag are embedded, and a variable-content database part including a group of database components with tags;

an input interface unit for inputting parameter information instructing a description change part in a target

10 document with respect to the template document;

a variable converting unit for defining the character train variable and the data variable with a tag on the basis of the input parameter information;

an entity referring unit for searching the template

15 database part and the variable-content database part on the basis of the character train variable and the data variable with a tag; and

a synthesizing unit for instantiating the character train variable in the template document retrieved by the search with

20 the definition of the character train variable, instantiating the data variable with a tag in the template document with the tagged database component retrieved by the search, and synthesizing the resultants, thereby creating a target document.

2. The document creation support system according to

25 claim 1, wherein the database component with a tag in the variable-content database part has a nested structure in which a character train variable and a data variable with a tag are embedded.
